## Como calcular Erro Aleatório Provável usando calculadora estatística\*

\*O procedimento é mostrado para a calculadora Casio FX-82MS

### 1- Limpar as memórias:

### 2- Entra no Modo Estatístico

### 3- Entrada dos dados:

Por exemplo (1,14±0,05) cm , (1,25±0,05) cm e (1,17±0,05) cm

1.14  : n = 1

1.25  : n = 2

1.17  : n = 3

### 4- Valores de média ( $\bar{x}$ ) e desvio padrão ( $\sigma$ ):

    : Valor médio ( $\bar{x} = 1.186666667$  cm)

    : Desvio padrão ( $\sigma = 0.056862407$  cm)

### 5- Agora você tem que calcular o desvio padrão da média ( $\sigma_m$ ) e o Erro Aleatório Provável ( $E_{ap}$ ):

$$E_{ap} = \sigma_m = \frac{\sigma}{\sqrt{N}}$$

$$\frac{0.056862407}{\sqrt{3}} = 0.032829526 ; \quad \text{portanto: } E_{ap} = 0,03 \text{ cm}$$

6- Erro total:  $E_{tot} = E_{esc} + E_{ap} = 0,082829526 = 0,08 \text{ cm}$

7- Resultado final:  $x = (1,19 \pm 0,08) \text{ cm}$
